121  Discovering Novel Interactions at the Nuclear Pore Complex Using Bead Halo: A Rapid Method for Detecting Molecular Interactions of High and Low Affinity at Equilibrium
    Samir S. Patel and Michael F. Rexach

On the cover, new strategies for characterization of interacting partners of protein complexes using affinity purification and SILAC-based quantitative MS analysis. Cells stably expressing Rpn11-HTBH were grown in light (L) medium, while cells stably expressing the HTBH tag alone were grown in heavy (H) medium. Two sample preparation strategies were employed: (a) PAM (purification after mixing) and (b) MAP (mixing after purification). Four types of proteins are classified here based on characteristic patterns of their SILAC ratios. For details, see the article by Wang and Huang, pages 46–57.
