On the cover: Urinary peptides (depicted based on mass, migration time, and signal intensity) detected by capillary-electrophoresis coupled ESI-TOF in the urine of patients with ANCA-associated vasculitis (AAV). Several of these peptides can be utilized as biomarkers in disease, as evident from the distribution in samples from controls and patients after therapy, shown below. For details, see the article by Haubitz et al., pages 2296–2307.
