On the Cover: Chlorotic *Synechocystis* sp. PCC 6803 cells (left) resuscitate from dormancy upon nitrogen availability in a stepwise developmental program. Transmission electron micrographs reveal the re-assembly of thylakoid membranes (*) and reduction of storage polymers (PHB, polyhydroxybutyrate granules; G, glycogen granules) after 24 h of resuscitation (top). After 48–72 h, cells reach a vegetative growth state and full photosynthetic capacity (right). For details, see the article by Forchhammer *et al.*, pages 1650–1669.
