On the cover: **Elucidation of a downstream nuclear PLC β 1 signaling effector in myogenesis.** Using a combinational approach of proteomics, immunocytochemistry and molecular biology, we have identified a functional insulin signaling cascade elicited by PLC β 1 in the nucleus. Release of diacylglycerol (DAG) from phosphoinositol-4,5-phosphate (PIP₂) results in the nuclear activation of PKC β 1 and subsequent phosphorylation of the eukaryotic elongation factor 1A (eEF1A) on Ser53. For details, see the article by Cocco *et al.*, pages 2719–2728.
