Supplemental Figure

**Autoradiograph of RMG-CM (day 14)**
RMG-CM was prepared in the presence of $^{35}$S-methionine to discriminate between residual serum factors and de novo synthesized proteins from RMG. 150µg total secreted proteins were separated by isoelectric focusing on pH 3-10 IPG strips in the first dimension and 12% SDS-PAGE in the second dimension. Autoradiograph was taken from dried gel and about 2200 distinct protein spots could be detected by this method from RMG-CM.
