Figure S2. Correlation between Accuracy (Mean %Acc) and fold change. The data demonstrate no statistical significance ($R^2 = 0.10$ and $0.015$) in the correlation between Mean % Acc and fold change for the phosphopeptides increased in P31/Fuj (left panels) or Kasumi-1 cells (right panels). This correlation was also low when all phosphopeptides were included in the analysis (bottom panels) as well as when only the ones that showed linearity were considered (upper panels).
