Supporting Figure 2 (Supporting Figure 2) Probing a collection of longitudinal *C. burnetii* infected patient and healthy control sera. Microarrays containing 2001 expression confirmed proteins were probed with patient sera, and average signal intensities for each antigen are shown. A) Antigens are in the same order between early and late time points, but not between IgG and IgM. B) Antigens are in the same order between early and late bar graphs to illustrate the distinct IgG and IgM repertoires.
