Supplemental Figure 5 - Acute and Chronic isotype switch

### Supporting Figure 5) Isotype switch in acute and chronic infection.
A screen for seroreactivity changes in acute and chronic infection was performed. All antigens exhibiting an average signal intensity change of 2000 units are displayed. Antigens displaying isotype switch are grouped on top, uncoupled changes in IgG in the middle, and uncoupled changes in IgM on the bottom. Antigens are sorted by decreasing chronic IgG signal intensity for the top and middle group, and by decreasing IgM signal intensity for the bottom group.
