On the cover: “**Beadfection**”. Protein is attached covalently to the shell of fluorescently-labelled core-shell microspheres by rapid, generic chemistry. Transit of loaded microspheres across the cell membrane via passive diffusion, takes up to 24 hours. Inside the cells, within 12 hours, the reducing environment of the cytoplasm cleaves the disulfide linker on the microspheres, thereby releasing the protein cargo. For details, see the article by David Nagel *et al.*, pages 1543–1551.
