On the cover: Illustrates the AlphaScreen nanobead assay, detecting interactions between two proteins. The blue donor bead is excited by a red laser (680 nm) and if the interaction between proteins occurs, the orange acceptor bead luminesces. The method was applied to measure propensity of dimer formation in the human SNX-BAR family. The background shows the color-coded heatmap of interactions obtained. For details, see the article by Emma Sierrecki, *et al.*, pages 2233–2245.
