On the cover: Hydrogen/deuterium exchange mass spectrometry (HDX-MS) of a full length IgG<sub>1</sub> antibody and the human FcRn (Neonatal Fc receptor) reveals regions protected from exchange (red and orange for IgG, green and yellow for FcRn) upon complex formation. Interestingly, reduced deuterium incorporation is observed both in the Fc and Fab regions of the antibody. For details see the article by Pernille Foged Jensen *et al.*, pages 148–161.
