Information

- 334 **Calendar**
- 336 **Instructions to Authors**

On the cover, differential protein expression levels were quantified for yeast growing under two nutrient-limiting conditions using both DiGE fluorescent labeling and metabolic stable isotope labeling to compare the capabilities of both methods frequently used in quantitative proteomic approaches. For details, see the article by Kolkman *et al.*, pages 255–266.

[S] Online version of this article contains supplemental material.
