On the cover, inactive Akt displays a folded structure in cytosol. Upon membrane interaction the pleckstrin homology and regulatory domains move away from the kinase domain exposing Thr<sup>308</sup> and Ser<sup>473</sup> for phosphorylation. When activated by phosphorylation, the pleckstrin homology domain closes, possibly enabling the separation of Akt from membrane. The regulatory domain remains open allowing substrate entry. Upon substrate binding a closed conformation is reestablished. For details, see the article by Huang and Kim, pages 1045–1053.
