On the cover: The study procedure of influence of blastomere biopsy was described. Mouse was used as animal model to evaluate the potential risk of blastomere biopsy. Our study suggested that the mouse behavior, especially in memory, could be sensitive to blastomere biopsy procedures besides some physiology index and indicated an increased relative risk of neurodegenerative disorders in the offspring generated following blastomere biopsy. For details, see the article by Yu *et al.*, pages 1490–1500.
